

This new Time Code system is designed to transmit time code from a camera to a recorder using a reliable and robust UHF link, operating at 434.075 MHz. It is narrow band and crystal controlled for high immunity to interference.

The Transmitters are DTI approved to EN 300-220 and do not require a licence.

MINIATURE TIME CODE TRANSMITTER 434.075 MHz

The UHF Time Code Miniature Transmitter is very small and light - only just a little longer than my ballpoint pen, as you can see).

It is housed in an attractive, durable, blue anodised case.

This Transmitter is powered from the camera via a 4 pin Hirose. Any one of the two Hirose's will do - they are identical and either one can be used for either power in or power out. A nice bright blue LED indicates power in.

Alternatively, for applications where the Transmitter cannot be powered from one of the 4 pin Hirose plugs, you can power the unit from an adapter allowing the use of a PP3 battery (however, a much more robust method would be our PP3 Battery Box which does the same thing but is more robust whilst compact and sturdy).

As a special treat, briefly mentioned above, this new version provides a second, spare, Hirose 4 pin socket for you to use with other things! So you get your Hirose back!

Its narrow band design gives excellent range up to 300 metres - maybe even more.

SELF POWERED TIME CODE TRANSMITTER 434.075 MHz

The self powered Time Code Transmitter can be powered either from its 4 pin Hirose or from a single PP3 type battery.

It accommodates a wide range of time code input levels, and data input is on a standard BNC.

You can expect a good range up to 300 metres.

The old locking toggle switch has gone (too many mole-wrench related breakages!) and we now have a very nice, neat, short toggle on/off switch.
